## 1 Sequences of functions

### 1.1 Convergence of a sequence of functions

**Definition 1.** Let  $D$  be a subset (non-empty) of  $\mathbb{R}$ , if we denote by  $\mathcal{F}(D, \mathbb{R})$  the  $\mathbb{R}$  vector space of real functions from  $D \rightarrow \mathbb{R}$ .

A sequence of functions over  $D$  is a sequence in  $\mathcal{F}(D, \mathbb{R})$  that is :

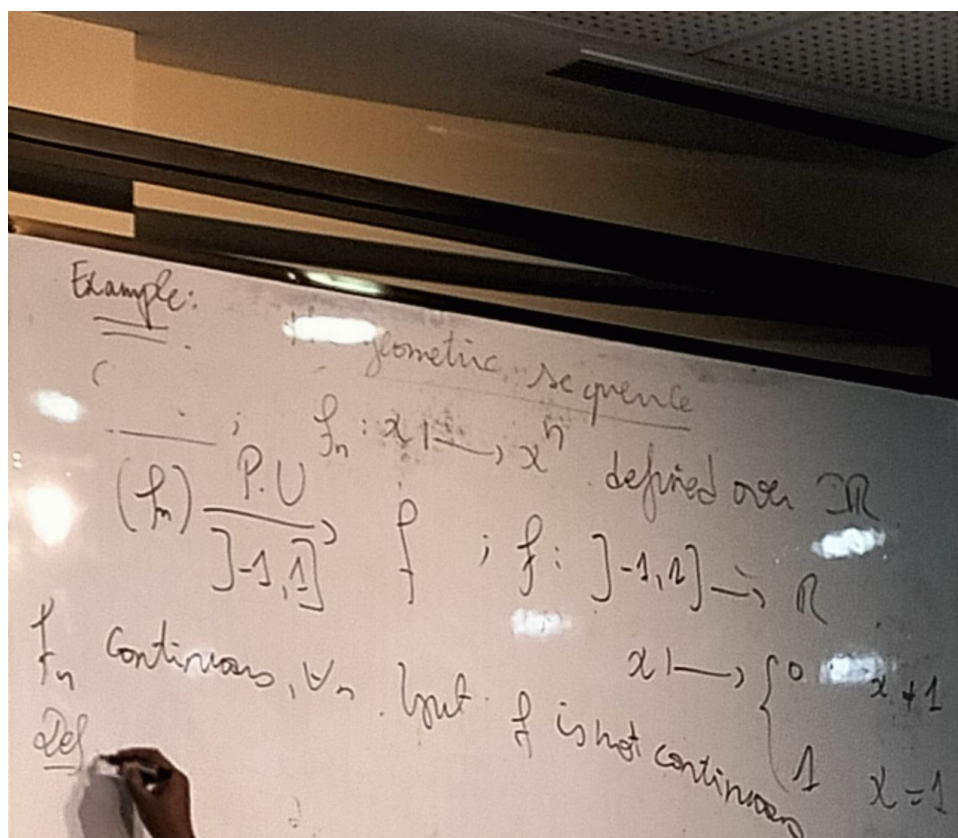

$$\begin{aligned} & \mathbb{N} \rightarrow \mathcal{F}(D, \mathbb{R}) \\ n & \mapsto f_n : \begin{cases} D \rightarrow \mathbb{R} \\ x \mapsto f_n(x) \end{cases} \quad \text{which is often denoted by } (f_n) \text{ or } (f_n)_{n \in \mathbb{N}} \end{aligned}$$

**Definition 2.** Let  $(f_n)$  be a sequence of functions over  $D$ ; we say that  $(f_n)$  positive convergente, or simply converges to  $f \in \mathcal{F} \rightarrow (D, \mathbb{R})$ , if :

$$\begin{aligned} \forall x \in D; \lim_{n \rightarrow +\infty} f_n(x) = f(x) \text{ or } (f_n) \xrightarrow{\text{point-wise converge}} f \\ \Leftrightarrow \lim_{n \rightarrow +\infty} f_n = f \end{aligned}$$

$$\forall x \in D, (\forall \epsilon > 0; \exists N = N(\epsilon, x) : \forall n \geq N : \forall n \in \mathbb{N}, |f_n(x) - f(x)| < \epsilon)$$

**Example 1.** ...

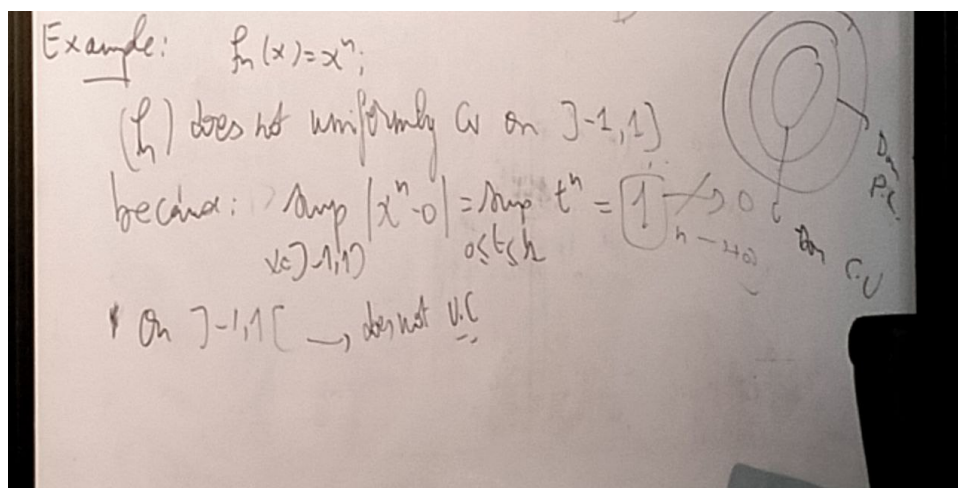

### Definition 3. Uniform convergence

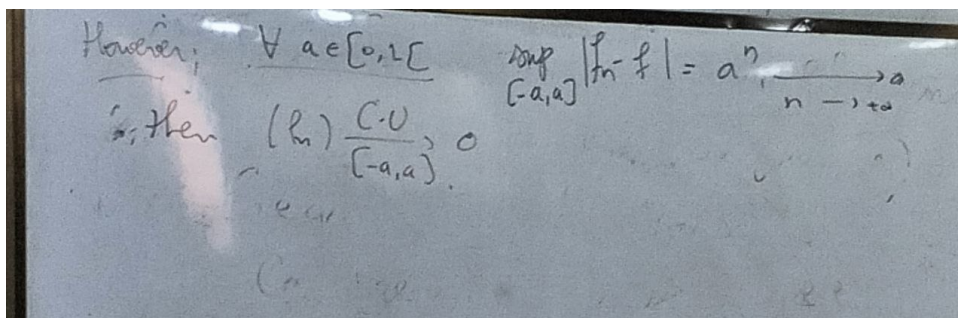

We say that  $(f_n) \xrightarrow[D]{C.V} f$  if  $\forall n \in \mathbb{N}$ ;  $(f_n - f)$  is bounded over  $D$  and  $\lim_{n \rightarrow +\infty} (\sup_D |f_n - f|) = 0$

$$\Leftrightarrow \forall \epsilon > 0, \exists N = N(\epsilon) : \forall n \geq N, \forall x \in D, |f_n(x) - f(x)| < \epsilon$$

**Remark:**  $(f_n) \xrightarrow[D]{C.V} f \implies (f_n) \xrightarrow[D]{P.V} f$

**Example 2. ...**

## 1.2 Properties of uniformly convergent sequences of functions

### Theorem 1. (continuity)

If

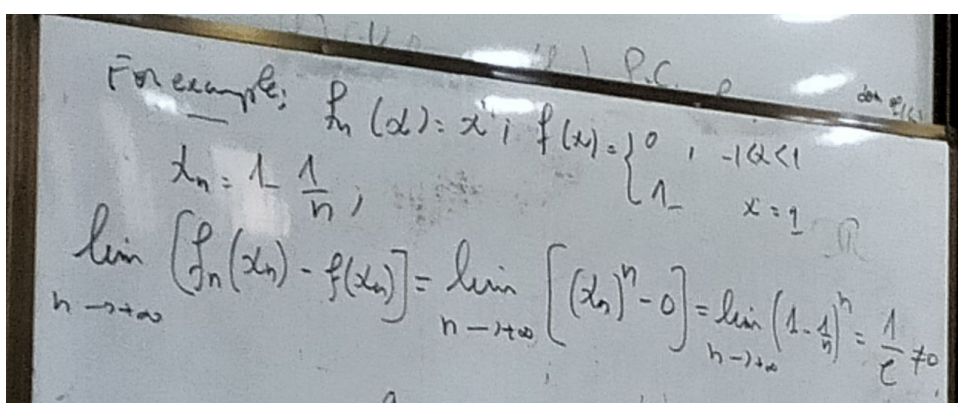

$$\left\{ \begin{array}{l} \exists N \in \mathbb{N} \mid \forall n \geq N, f_n \text{ continuous on } D \\ \text{and } (f_n) \xrightarrow[D]{C.V.} f \end{array} \right. \quad \text{then } f \text{ is continuous}$$

$$\begin{aligned} \forall x_0 \in D; \lim_{x \rightarrow x_0} f(x) &= \lim_{x \rightarrow x_0} \left( \lim_{n \rightarrow +\infty} f_n(x) \right) \\ &= \lim_{n \rightarrow +\infty} \left( \lim_{x \rightarrow x_0} f_n(x) \right) = f(x_0) \end{aligned}$$

**Remark:** if  $(f_n) \xrightarrow[D]{P.C.} f$  and  $(x_n) \subset D \mid \lim_{n \rightarrow +\infty} [f_n(x_n) - f(x_n)] \neq 0$  then  $(f_n)_{n \in \mathbb{N}}$  does not uniformly converge to  $f$  on  $D$  because :

$$(f_n) \xrightarrow[D]{C.V.} f \implies \forall (x_n) \subset D : \lim_{n \rightarrow +\infty} [f_n(x_n) - f(x_n)] = 0$$

**Example 3. ...**

### Theorem 2. (integrability)

if  $f_n : [a, b] \rightarrow \mathbb{R}$  is Riemann-integrable,  $\forall n \in \mathbb{N}$  and  $(f_n) \xrightarrow[D]{C.V.} f$ ; then :

$$\lim_{n \rightarrow +\infty} \int_a^b f_n(x) dx = \int_a^b f(x) dx = \int_a^b \left( \lim_{n \rightarrow +\infty} f_n(x) \right) dx$$

proof:

$$\begin{aligned}
 \left| \int_a^b f_n(x) dx - \int_a^b f(x) dx \right| &= \left| \int_a^b (f_n(x) - f(x)) dx \right| \\
 &\leq \int_a^b |f_n(x) - f(x)| dx \\
 &\leq (\sup_{[a,b]} (f_n - f))(b-a) \xrightarrow{n \rightarrow +\infty} 0
 \end{aligned}$$

Example 4. ..

Example:  $f_n(x) = \begin{cases} n-nx & \text{if } 0 \leq x \leq \frac{1}{n} \\ 0 & \text{otherwise} \end{cases}$

$f_n(0) = 0, \forall n \in \mathbb{N} \Rightarrow \lim_{n \rightarrow +\infty} f_n(0) = 0$

$\forall x > 0, \exists N \in \mathbb{N}; \forall n > N \Rightarrow f_n(x) = 0$

$\forall n > N, \forall x \geq \frac{1}{n} \Rightarrow f_n(x) = 0$

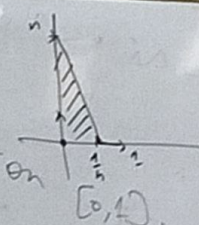

$\lim_{n \rightarrow +\infty} f_n(x) = 0$

$\int_0^1 |f_n(x) - f(x)| dx = \int_0^{\frac{1}{n}} (n-nx) dx = \frac{1}{2n} \rightarrow 0$

$\Rightarrow (f_n) \xrightarrow{PC} 0$  on  $[0,1]$

$\lim_{n \rightarrow +\infty} \int_0^1 f_n(x) dx = \frac{1}{2} \neq \lim_{n \rightarrow +\infty} \int_0^1 0 dx = 0$

so,  $(f_n)$  does not uniformly converge on  $[0,1]$ .

**Theorem 3.** (differentiability)

Let  $I$  an interval;  $(f_n)_n$  a sequence of class  $C^1$  functions on  $I$  such that:  $(f'_n)_n \xrightarrow{C.V} g$  and  $\exists x_0 \in I$  the numerical sequence  $f_n(x_0)$  converges to a real number  $l$

then:  $(f'_n)_n \xrightarrow{C.V} f'$  / where  $f$  is defined by:  $\begin{cases} f' = g \\ f(x_0) = l \end{cases}$

so ;

$$\lim_{n \rightarrow +\infty} f'_n(x) = g(x) = f'(x) = \left( \lim_{n \rightarrow +\infty} f_n(x) \right)'$$

***Proof:***

$$f(x) = l + \int_{x_0}^x g(t)dt, \forall x \in I$$

*Recall that :  $f_n(x) = f_n(x_0) + \int_{x_0}^x f'_n(t)dt$*

*Using the integrability theorem we get :  $(f_n) \xrightarrow[I]{P.C} f$*

*(P.C means point-wise continuous )*
